

Project - Brief

OldNews.network is developing a news platform that will support their editors and journalists by making a new editor and publication application that allows for author-drafts, editor-reviews and submissions along with capabilities to publish.

The main users of this platform are editors and writers.

Writers have the ability to:

- Create, Delete and Update their own documents and share them as a draft
- Submit them to an editor who will review it and approve it for publication
- Create copies of their own work, usually for maintaining a version history of their documents

Editors have the same capabilities as writers, however they cannot submit documents to themselves. They also have the ability to:

- Review their reviewer inbox, this inbox outlines what documents have been submitted to them by writers.
- Approve and/or Reject submissions sent to them.
 - When approved, the editor can select to publish the document
 - When rejected, the document will revert to draft state for the writer.
- Be able to pull published articles they have made.

Make sure you model the data appropriately and encode the state effectively. You will need to build an account system for your project along with a database.

Make sure you use the following technologies:

- Javascript/Node.js
- ExpressJS
- React and Vite
- MongoDB for the database (or Sequelize)
